Abstract of JP2002358289

PROBLEM TO BE SOLVED: To provide a computer architecture for a high-speed processing and a programming model via a broadband network. **SOLUTION:** The architecture uses a uniform modular structure, a common computing module and a uniform software cell. The common module includes a control device, more than one processing unit, more than one local memory causing the processing units to process a program, a direct memory access, a controller and a shared main memory. A synchronizing system and method causing the processing units to execute adjusted reading and writing of data from the shared main memory are provided.
